

RYEGRASS

TETILIA (Italian)

LATE MATURITY

SEEDWAY
EST 1963

Tetilia tetraploid Italian ryegrass offers superior yield for winter feed, hay, or silage, with increased stand persistence and compatibility with clover mixtures. It is highly palatable, digestible, and nutritious, with late maturity and excellent seedling vigor, ensuring quick establishment and outstanding regrowth. Known for its great crown and stem rust resistance, Tetilia provides an excellent start for high-milk-producing dairy pastures and supports strong weight gains in beef herds. This variety is often ready to graze in less than two months after planting.
